MDR TB

Dr. Sandeep Sharma

DM- Seminar

Global and national magnitude of DR-TB problem

- Globally, estimated 450 000 incident cases MDR/RR-TB in 2021
- New TB cases with MDR/RR-TB 3.6% & previously treated cases was 18%
- The countries with the largest share of incident cases of MDR/RR-TB in 2021 were India (26% of global cases), the Russian Federation (8.5% of global cases) and Pakistan (7.9% of global cases)
- The estimated proportion of MDR/RR-TB cases with pre-XDR (i.e. resistance to any fluoroquinolone for which testing was done) was 20%

WHO Global TB report

Global and national magnitude of DR-TB problem

- Estimated number of MDR/RR-TB cases in India is 124 000 (9.1/lakh population)

NDRS (INDIA)	All	New	Previously treated TB
Resistant to any drugs	28%	22%	36.82%
MDR-TB	6.19%	2.84%	11.62%
Isoniazid (H) resistance	16%	11.6%	25%

PMDT 2021

No.	Indicator	Achievement in 2022
1	No. of notified bacteriological confirmed TB patients	12,32,149 (51%)
2	No. of bacteriologically confirmed TB patients with valid rapid DRT result for at least Rifampicin (RS/RR)	9,38,217 (76%)
3	No. of Rifampicin resistant TB patients diagnosed (MDR/ RR-TB)	63,801
4	No. of Rifampicin resistant TB patients with a valid DST result available for at least fluoroquinolone	23,846 (37%)
5	No. of Rifampicin resistant TB patients with FQ resistance diagnosed (Pre-XDR-TB)	12,002
6	No. of Rifampicin resistant TB patients with FQ resistance with a DST result available for Bedaquiline/ Linezolid	1187 (10%)
7	No. of Rifampicin resistant TB patients with FQ resistance diagnosed with resistant to Bedaquline/ Linezolid or both (XDR-TB)	85
8	No. of bacteriologically confirmed patients (with Rifampicin resistance not detected) with a DST result available for at least Isoniazid	2,04,034 (23%)
9	No. of Rifampicin resistance not detected patients with Isoniazid resistance diagnosed (H Mono-poly DR-TB)	15,953

Definitions

5 categories of drug-resistant TB

1. **Isoniazid (INH)-resistant TB**
2. **RR TB**- whose biological specimen is resistant to R, detected using phenotypic or genotypic methods, with or without resistance to other anti-TB drugs. It includes any resistance to R, in the form of mono-resistance, poly-resistance, MDR or XDR
3. **MDR-TB** -RR and INH resistant
4. **Pre-XDRTB** (Pre-extensively drug-resistant TB) -resistant to rifampicin (MDR/RR-TB) and any fluoroquinolone
5. **XDR-TB** -TB that is resistant to rifampicin (MDR/RR-TB), plus any fluoroquinolone, plus at least one of the group A drugs, bedaquiline and linezolid or both

Detection of drug resistance/susceptibility

- **Genotypic tests**-Rapid molecular diagnostic method for Drug Resistance Testing (DRT)- These are genotypic tests that detect specific genetic mutations that are associated with drug resistance
- **Phenotypic tests** -Growth based Drug Susceptibility Testing (DST) ,wherein bacilli are grown and subsequently tested for drug susceptibility using various drug containing and drug-free media

Rapid molecular drug resistance testing (genotypic tests)

- Xpert MTB/RIF is a cartridge-based NAAT (CB-NAAT)
- The Xpert MTB/XDR
- Truenat MTB and Truenat MTB-Rif Dx
- Line probe assays (LPA)
- Genetic sequencing

Cartridge-based NAAT (CB-NAAT)

	GeneXpert MTB/RIF	Xpert ULTRA
MTB Detection and RIF determination	Semi-Quantitative hemi-nested PCR Cycle threshold probe comparison	Semi-Quantitative nested PCR High Resolution Melt technology
Targets	Detection of a single copy target: rpoB gene (5 probes)	Detection of a single copy target: rpoB gene (4 probes), Detection of 2 different multi-copy targets: IS6110 & IS1081 (2 probes)
Turn around Time (TAT)	110 min	< 80 min
RIF resistance detection	false-positive results for strains that carry phenotypically silent mutations (synonymous mutations), or for paucibacillary specimen	low specificity
Limit Of Detection	131 cfu/ml	11.8 cfu/ml
Semi-Quantification	High, Medium, Low, and Very Low	High, Medium, Low, Very Low, and Trace

Xpert Ultra versus Xpert MTB/RIF for pulmonary tuberculosis and rifampicin resistance in adults with presumptive pulmonary tuberculosis (Review)

Zifodya JS, Kreniske JS, Schiller I, Kohli M, Dendukuri N, Schumacher SG, Ochodo EA, Haraka F, Zwerling AA, Pai M, Steingart KR, Horne DJ

Aim- To determine how accurate Xpert Ultra is compared with Xpert MTB/RIF for diagnosing pulmonary tuberculosis and rifampicin resistance in adults

Method- compared the diagnostic accuracy of Xpert Ultra and Xpert MTB/RIF with results primarily measured **against culture** (detection of pulmonary tuberculosis) and **DST and LPA** (detection of rifampicin resistance)

Studies- 9 studies (n=3500) compared Xpert Ultra to Xpert MTB/RIF for diagnosing pulmonary tuberculosis, and 5 studies (n=930) compared Xpert Ultra to Xpert MTB/RIF for rifampicin resistance.

Cochrane Database of Systematic Reviews 2021, Issue 2. Art. No.: CD009593.

Xpert MTB/XDR

- Xpert MTB/XDR detects mutations associated with resistance towards isoniazid , fluoroquinolones , second-line injectable drug (SLI) (amikacin, kanamycin, capreomycin) and ethionamide in a single test
- The test uses a semi quantitative nested PCR followed by high resolution melt technology
- Results are available in less than 90 minutes
- It can potentially improve access to rapid drug susceptibility testing, especially for ruling out fluoroquinolone resistance, which is required before starting the shorter oral Bedaquiline-containing MDR/RR-TB regimen

Truenat real-time quantitative micro PCR system by Molbio

Molbio Diagnostics (Bangalore, India) developed three assays that utilise chip-based real-time micro PCR:

- **Two for detection of M. tuberculosis** (the **Truenat MTB** assay (including the nrdB single copy target) and the **MTB Plus assay** (including nrdZ and multicopy IS6110 targets) and
- One for the detection of RIF resistance (**the MTB-RIF Dx reflex assay** targeting the rpoB gene) .
- A point-of-care, cost-effective assay with higher performance and/or a robust, battery-operated assay with minimal operational requirements
- Could provide a viable alternative to Xpert and drive greater access for TB testing
- Both the devices are portable, battery operated, and can function at up to 40°C ambient temperature and up to 80% relative humidity

A prospective multicentre diagnostic accuracy study for the Truenat tuberculosis assays

Abstract

Background Bringing reliable and accurate tuberculosis (TB) diagnosis closer to patients is a key priority for global TB control. Molbio Diagnostics have developed the Truenat point-of-care molecular assays for detection of TB and rifampicin (RIF) resistance.

Methods We conducted a prospective multicentre diagnostic accuracy study at 19 primary healthcare centres and seven reference laboratories in Peru, India, Ethiopia and Papua New Guinea to estimate the diagnostic accuracy of the point-of-care Truenat MTB, MTB Plus and MTB-RIF Dx assays for pulmonary TB using culture and phenotypic drug susceptibility testing as the reference standard, compared with Xpert MTB/RIF or Ultra.

Results Of 1807 enrolled participants with TB signs/symptoms, 24% were culture-positive for *Mycobacterium tuberculosis*, of which 15% were RIF-resistant. In microscopy centres, the pooled sensitivity of Truenat MTB and Truenat MTB Plus was 73% (95% CI 67–78%) and 80% (95% CI 75–84%), respectively. Among smear-negative specimens, sensitivities were 36% (95% CI 27–47%) and 47% (95% CI 37–58%), respectively. Sensitivity of Truenat MTB-RIF was 84% (95% CI 62–95%). Truenat assays showed high specificity. Head-to-head comparison in the central reference laboratories suggested that the Truenat assays have similar performance to Xpert MTB/RIF.

Conclusion We found the performance of Molbio's Truenat MTB, MTB Plus and MTB-RIF Dx assays to be comparable to that of the Xpert MTB/RIF assay. Performing the Truenat tests in primary healthcare centres with very limited infrastructure was feasible. These data supported the development of a World Health Organization policy recommendation of the Molbio assays.

Eur Respir J 2021; 58: 2100526

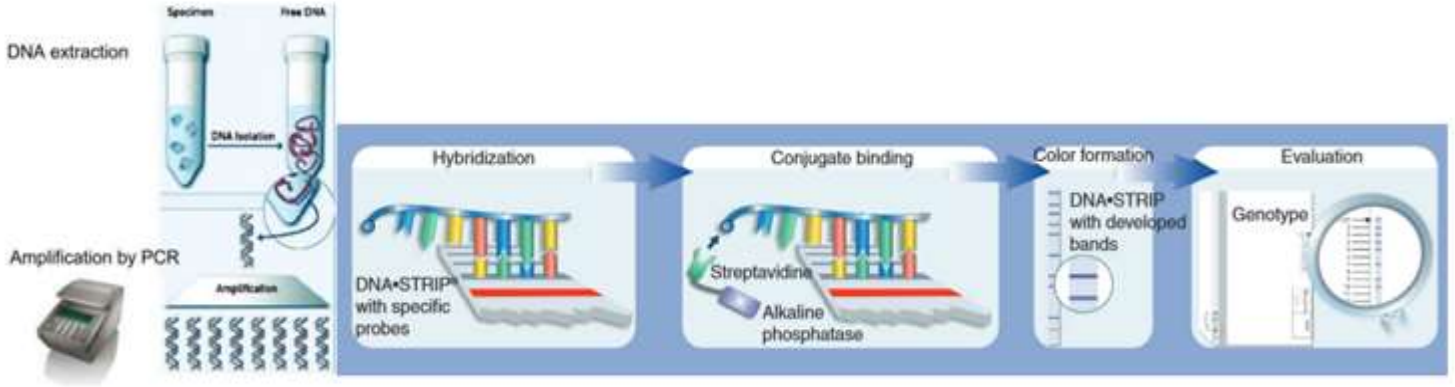
LPA



- LPA uses PCR and reverse hybridization methods for detection of mutation associated with drug resistance
- Frist line LPA detects mutations in the rpoB gene for R resistance; in the KatG gene and the InhA promoter region for H [and ethionamide (Eto)] resistance
- second line LPA detects mutations in genes gyrA & gyr B for FQ resistance and rrs and eis (low level kanamycin resistance) for SLID resistance

LPA

- Results of LPA are interpreted based on development/ absence of Wild Type (WT) and Mutant (MUT) bands.
- **Resistance not detected** -When **all WT probes** in the regions of the gene known to confer resistance to the drug are **developed** and **none** of the **MUT probes** in the corresponding region are developed
- **Resistance inferred-** whenever **one or more WT probes** in regions of the gene known to confer resistance to the drug are **not developed** and **none** of the **MUT probes** in the corresponding region are developed
- **Resistance detected-**is used whenever **one or more MUT probes** identifying specific mutations conferring resistance to the drugs are **developed**; regardless of whether WT probes are developed or not

Table 3.1: LPA results and their clinical interpretation for programmatic use

Drug	Gene	Test results	Clinical interpretation
Rifampicin	rpoB	Resistance inferred or detected	R is not effective
Isoniazid	katG	Resistance to high level H inferred or detected	H is unlikely to be effective even at high dose
	InhA	Resistance to low level H inferred or detected	H at high dose is likely effective. Eto/Pto are not effective
Fluoroquinolones	gyrA	Resistance to Lfx and low level Mfx inferred Resistance to Lfx and low level Mfx detected	Lfx is not effective. Mfx could be used at higher dose. The regimen should be reevaluated based on phenotypic DST results to Mfx at clinical breakpoint
		Resistance Lfx and high level Mfx detected (MUT 3B, MUT 3C, MUT 3D)	Lfx / Mfx is not effective
	gyrB	Resistance to Lfx and low level Mfx inferred Resistance to Lfx and low level Mfx detected	Lfx is not effective. Mfx could be used at higher dose. The regimen should be re-evaluated based on phenotypic DST results to Mfx at clinical breakpoint.
Second-line injectable drugs	rrs	Resistance inferred or detected	Am, Km and Cm are not effective
		Resistance to Am inferred (mutation at 1402)	Km and Cm are likely not effective. Phenotypic DST result should guide the choice to use Am in the treatment regimen
	eis	Resistance inferred or detected	Am and Cm are likely effective. Km is not effective

Systematic evaluation of line probe assays for the diagnosis of tuberculosis and drug-resistant tuberculosis

Background: Line probe assays (LPAs) are PCR-based assays used for the rapid diagnosis of *Mycobacterium tuberculosis* (MTB) and drug-resistant tuberculosis (DR-TB). But studies on its performance are insufficient. Thus, in this study, we conducted a systematic review and meta-analysis to evaluate the effect of LPAs in the detection of MTB and drug-resistant TB in comparison with the traditional culture and DST methods.

Methods: A systemic literature search was conducted on the Web of Science, Embase, PubMed, the Cochrane Library, Scopus, and OVID databases. All the included studies were classified according to different detecting objects. Sensitivity, specificity, Positive Likely Ratio (PLR), Negative Likely Ratio (NLR), Diagnostic Odds Ratio (DOR), corresponding 95% confidence interval, Area Under Curve (AUC), Deeks' funnel plot, and Bivariate Boxplot was used to do the evaluation.

Results: 147 studies included 491 datasets, with 182,448 samples, were incorporated into our analysis. The sensitivity (95% CI), specificity (95% CI), PLR, NLR, DOR and AUC for MTB were 0.89 (0.86 to 0.92), 0.94 (0.90 to 0.97), 15.70, 0.11, 139 and 0.96, respectively; for rifampicin-resistant TB were 0.96 (0.95 to 0.97), 0.99 (0.98 to 0.99), 82.9, 0.04, 1994 and 1.00, respectively; for isoniazid-resistant TB were 0.91 (0.89 to 0.93), 0.99 (0.98 to 0.99), 83.4, 0.09, (0.99 to 1.00), 195.7, 0.07, 2783 and 1.00, respectively; for Multi-drug resistant TB (MDR-TB) were 0.93 (0.90 to 0.95), 1.00 (0.99 to 1.00), 195.7, 0.07, 2783 and 1.00, respectively; for extensively drug-resistant TB (XDR-TB) were 0.60 (0.33 to 0.82), 1.00 (0.95 to 1.00), 291.3, 0.4, 726 and 0.95, respectively; for (second-line drug-resistant TB) SLID-TB were 0.83 (0.78 to 0.87), 0.98 (0.97 to 0.99), 44.6, 0.17, 262 and 0.98, respectively. Sensitivity in pre-extensively drug-resistant TB (Pre-XDR-TB) was 0.67, specificity was 0.91. No publication bias existed according to Deeks' funnel plot.

Conclusion: High diagnosis performance was confirmed in LPAs for the diagnosis of MTB and drug-resistant TB. LPAs might be a good alternative to culture and DST in detecting MTB, RR-TB, INH-TB, XDR-TB, SLID-TB, and MDR-TB. While more studies were still needed to explore the diagnosis performance of LPAs for Pre-XDR TB.

Growth-based drug susceptibility testing (DST) (phenotypic tests)

- **Liquid culture -BACTEC MGIT 960**
  - Automated Liquid Culture System
  - Higher rate of MTB isolation
  - Requires a shorter turnaround time
  - MGIT is the preferred method for DST
  - Used to monitor response to treatment
  - Long-term follow-up of patients on DR TB treatment
- **Solid culture (Lowenstein–Jensen)**
  - Longer turnaround time
  - Due to the higher rate of contamination in liquid culture, an LJ slope is inoculated as a backup for every MGIT culture

Genetic sequencing

- Resistance in MTB is mainly conferred through point mutations in specific gene targets
- Targeted sequencing can be achieved through Pyrosequencing, Sanger sequencing as well as Next-generation sequencing (NGS)
- NGS technology have enabled the routine use of NGS for both targeted NGS and WGS of Mycobacterium tuberculosis complex (MTBC) samples
- WGS can provide the near complete genome of Mycobacterium tuberculosis (MTB)
- Targeted NGS can generate MTB sequence data at specific genetic loci of interest
- NGS offers great promise for rapid diagnosis of DR-TB

Value of routine whole genome sequencing for *Mycobacterium tuberculosis* drug resistance detection

Connie Lam[a,*], Elena Martinez[b], Taryn Crighton[b], Catriona Furlong[c], Ellen Donnan[c], Ben J. Marais[d,e], Vitali Sintchenko[a,b,d]

ABSTRACT

Routine whole genome sequencing (WGS) of pathogens is becoming more feasible as sequencing costs decrease and access to benchtop sequencing equipment and bioinformatics pipelines increases. This study examined the added value gained from implementing routine WGS of all *Mycobacterium tuberculosis* isolates in New South Wales, Australia.

Drug resistance markers inferred from WGS data were compared to commercial genotypic drug susceptibility testing (DST) assays and conventional phenotypic DST in all isolates sequenced between 2016 and 2019. Of the 1107 clinical *M. tuberculosis* isolates sequenced, 29 (2.6%) were multi-drug resistant (MDR); most belonged to Beijing (336; 30.4%) or East-African Indian (332; 30%) lineages. Compared with conventional phenotypic DST, WGS identified an additional 1% of isolates which were likely drug resistant, explained by mutations previously associated with treatment failure and mixed bacterial populations. However, WGS provided a 20% increase in drug resistance detection in comparison with commercial genotypic assays by identifying mutations outside of the classic resistance determining regions in *rpoB*, *inhA*, *katG*, *pncA* and *embB* genes. Gains in drug resistance detection were significant ($p = 0.0137$, paired *t*-test), but varied substantially for different phylogenetic lineages.

In low incidence settings, routine WGS of *M. tuberculosis* provides better guidance for person-centered management of drug resistant tuberculosis than commercial genotypic assays.

Value of routine whole genome sequencing for *Mycobacterium tuberculosis* drug resistance detection

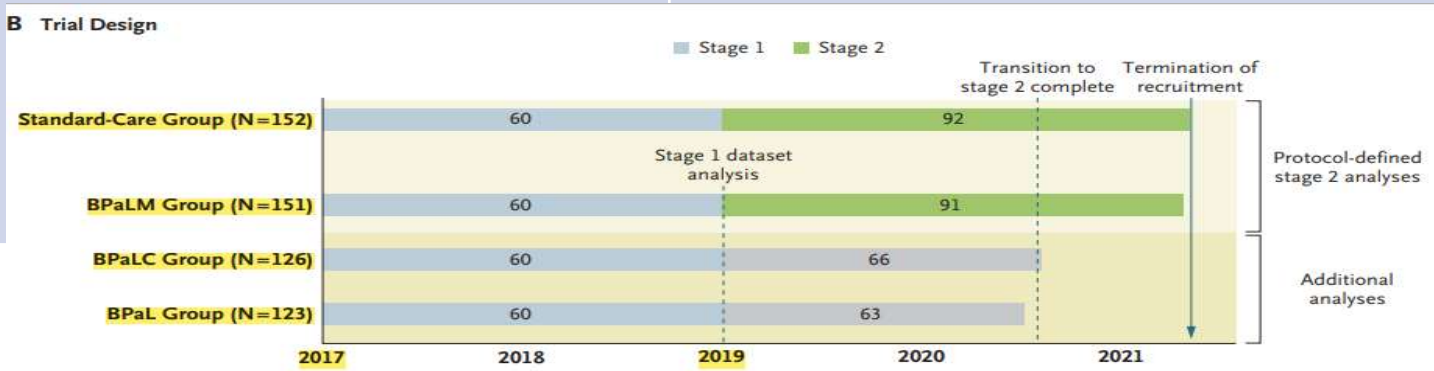
A 24-Week, All-Oral Regimen for Rifampin-Resistant Tuberculosis

TB-PRACTECAL study

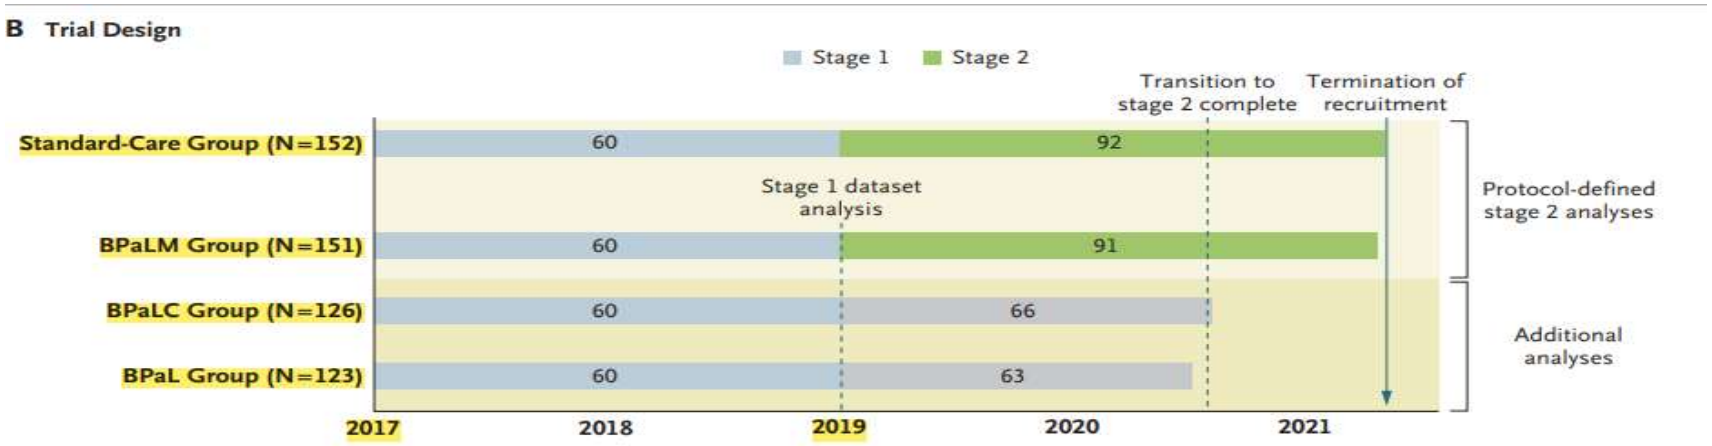
STUDY	Intervention	Regimens
• Open-label, phase 2–3, multicenter, randomized, controlled **noninferiority trial** • Aim- to compare the safety and efficacy of **three investigational 24-week regimens** with those of the **accepted 9-to-20-month** standard-care treatment for **rifampin-resistant pulmonary tuberculosis**	• In stage 1 of the trial, enrolled patients were randomly assigned to the locally accepted standard-care treatment or to one of three investigational regimens • In stage 2 of the trial patients were enrolled either into the standard-care group or into one of two investigational groups. • **N=522**	• **The BPaL** -bedaquiline at a dose of 400 mg daily for 2 weeks, followed by 200 mg three times per week for 22 weeks; pretomanid at a dose of 200 mg daily for 24 weeks; and linezolid at a dose of 600 mg daily for 16 weeks, followed by 300 mg daily for 8 weeks. • **The BPaLM** regimen included BPaL plus moxifloxacin at a dose of 400 mg daily for 24 weeks, • **BPaLC regimen** included BPaL plus clofazimine at a dose of 100 mg daily (or 50 mg if the patient weighed <30 kg)



N Engl J Med 2022;387:2331-43.

TB-PRACTECAL study

- In stage 1 of the trial, the percentages of patients with culture conversion in liquid medium at 8 weeks after randomization were **77%, 67%, and 46%** in the **BPaLM, BPaLC, and BPaL** groups, respectively ; **8%, 6%, and 10%** of the patients, respectively, discontinued treatment or died.
- The BPaLM regimen was selected for analysis in stage 2 of the trial.



TB-PRACTECAL study

Table 2. Primary Efficacy Analysis at 72 Weeks.

Background. Treatment success rates for multidrug-resistant tuberculosis (MDR-TB) remain low globally. Availability of newer drugs has given scope to develop regimens that can be patient-friendly, less toxic, with improved outcomes. We proposed to determine the effectiveness of an entirely oral, short-course regimen with bedaquiline and delamanid in treating MDR-TB with additional resistance to fluoroquinolones (MDR-TB_{FQ+}) or second-line injectable (MDR-TB_{SLI+}).

Methods. We prospectively determined the effectiveness and safety of combining 2 new drugs with 2 repurposed drugs—bedaquiline, delamanid, linezolid, and clofazimine—for 24–36 weeks in adults with pulmonary MDR-TB_{FQ+} and/or MDR-TB_{SLI+}. The primary outcome was a favorable response at end of treatment, defined as 2 consecutive negative cultures taken 4 weeks apart. The unfavorable outcomes included bacteriologic or clinical failure during the treatment period.

Results. Of the 165 participants enrolled, 158 had MDR-TB_{FQ+}. At the end of treatment, after excluding 12 patients due to baseline drug susceptibility and culture negatives, 139 of 153 patients (91%) had a favorable outcome. Fourteen patients (9%) had unfavorable outcomes: 4 deaths, 7 treatment changes, 2 bacteriological failures, and 1 withdrawal. During treatment, 85 patients (52%) developed myelosuppression, 69 (42%) reported peripheral neuropathy, and none had QTc(F) prolongation >500 ms. At 48 weeks of follow-up, 131 patients showed sustained treatment success with the resolution of adverse events in the majority.

Conclusions. After 24–36 weeks of treatment, this regimen resulted in a satisfactory favorable outcome in pulmonary MDR-TB patients with additional drug resistance. Cardiotoxicity was minimal, and myelosuppression, while common, was detected early and treated successfully.

- **Fully oral short-course regimen of BDQ and DLM with other drugs gives a favorable outcome of 91% in patients with MDR-TBFQ+/SLI+ and 69% in those with both FQ and SLI resistance.**
- **The median time to culture conversion was 8 weeks**

Clin Infect Dis. 2022 Jun 29;76(3):e938–46

ORIGINAL ARTICLE

An All-Oral 6-Month Regimen for Multidrug-Resistant Tuberculosis
A Multicenter, Randomized Controlled Clinical Trial (the NExT Study)

STUDY	INTERVENTION	OUTCOMES	RESULTS
• Multicenter RCT • Adults MDR/RR-TB • 93 of 111 randomized participants (44 in the comparator arm and 49 in the interventional arm)	• Randomised (1:1 ratio) to a 6- month all-oral regimen that included levofloxacin, bedaquiline, linezolid and two other group B/C drugs, **vs** • the standard-of-care (SOC) >9-month World Health Organization (WHO)-approved injectable-based regimen	• The primary endpoint was a favorable WHO-defined treatment outcome 24 months after treatment initiation • The trial was stopped prematurely when bedaquiline-based therapy became the standard of care in South Africa.	• Participants in the intervention arm were 2.2 times more likely to experience **a favorable 24-month outcome** than participants in the SOC arm (51% vs22.7%; risk ratio, 2.2 [1.2–4.1]; P=0.006) • **Toxicity-related drug** substitution occurred more frequently in the SOC arm (65.9% vs. 34.7% ; P=0.001)]

Am J Respir Crit Care Med Vol 205, Iss 10, pp 1214–1227, May 15, 2022

MDR/RR-TB patients recruited from 5 sites across South Africa

Conventional Arm
(5 to 6 drug injection-based regimen)

1:1 Randomization

Interventional Arm
(5 drug all-oral regimen)

December 2014 – September 2016
(18–20 months treatment duration)*

Drug	Daily Dose
1. Kanamycin†	500–750mg (40–50kg) 1,000mg (51–90kg)
2. Moxifloxacin	400mg
3. Clofazimine	50mg (<30kg) 100mg (>30kg)
4. Pyrazinamide	1,000–1,750mg (40–50kg) 1,750–2,000mg (51–70kg) 2,000–2,500mg (71–90kg)
5. Terizidone‡ **or** Ethionamide‡ **or** High dose Isoniazid‡	750mg (40–70kg) 750–1,000mg (71–90kg) 500mg (40–50kg) 750mg (51–70kg) 750–1,000mg (71–90kg) 10–15mg/kg

- **Follow-up for 12 months post-treatment completion**

December 2016 – September 2018
(9–11 months treatment duration)*

Drug	Daily dose and Frequency
1. Kanamycin§	15mg/kg (max 1,000mg)
2. Moxifloxacin **or** Levofloxacin	400mg 750mg(≤50kg) 1,000mg (>50kg)
3.Clofazimine	50mg (<30kg) 100mg (>30kg)
4.Pyrazinamide	1,000mg (<30kg) 1,500mg (>30–50kg) 2,000mg (>50kg)
5.Ethambutol	800mg (<30–50kg) 1,200mg (>50kg)
6.Terizidone‡§ **or** Ethionamide‡§ **or** High dose Isoniazid‡§	750mg (40–70kg) 750–1,000mg (71–90kg) 500mg (40–50kg) 750mg (51–70kg) 750–1,000mg (71–90kg) 10–15mg/kg

- **Follow-up for 13–15 months post-treatment completion**

December 2014 – October 2018
(6–9 month treatment duration)*

Drug	Daily dose and Frequency
1. Bedaquiline (Group A)	400mg daily for 2 weeks followed by 200mg 3 times a week for 24 weeks
2. Linezolid (Group A)	600mg
3. Levofloxacin (Group A)	750mg (≤50kg) 1,000mg (>50kg)
4. Pyrazinamide (Group C)	1,000–1,750mg (40–50kg) 1,750–2,000mg (51–70kg) 2,000–2,500mg (71–90kg)
5. Terizidone‖ (Group B) **or** Ethionamide‖ (Group C) **or** High dose Isoniazid‖ (Group C)	750mg (40–70kg) 750–1,000mg (71–90kg) 15mg/kg (maximum of 900mg) 500mg (40–50kg) 750mg (51–70kg) 750–1,000mg (71–90kg)

- **Follow-up for 15–18 months post-treatment completion**

November 2018

Trial terminated due to the inclusion of bedaquiline into the South African National TB Program's MDR-TB treatment regimen

November 2020

Completion of 24-month follow-up post-treatment initiation for all patients

Table 2. Comparison of Primary and Secondary Endpoints in Each Arm Using the Modified Intention-to-Treat Population ($n = 93$) Unless Otherwise Specified

Description of Endpoint	SOC	BDQ/LZD	Relative Risk Ratio (95% CI)	Risk Difference % (95% CI)	*P* Value*
Primary endpoint					
Favorable outcomes at 24 mo after initiation of treatment, *n* (%)	10/44 (22.7)	25/49 (51.0)	2.2 (1.2 to 4.1)	28.3 (9.6 to 47.0)	0.006
Time to unfavorable outcome (event-free survival) over 24-mo	N/A	N/A	Hazard ratio, 0.4 (95% CI, 0.2 to 0.6)		<0.001
Restricted mean time lost, mo†	15.8 (13.0–18.5)†	8.6 (5.9–11.2)	RMTL ratio, 0.5 (95% CI, 0.4 to 0.8)†		0.001†
Secondary endpoints					
Time point–specific WHO-defined favorable outcomes after treatment initiation‡					
Favorable outcomes at 24 mo after treatment initiation in the per-protocol population	10/43 (23.3)	25/44 (56.8)	2.4 (1.3 to 4.5)	33.6 (14.2 to 52.9)	0.002
Favorable outcomes after treatment completion§					
Favorable outcome at treatment completion (specifically at the time point of treatment cessation)					
mITT population	11/44 (25.0)	28/49 (57.1)	1.9 (1.3 to 2.7)	4.0 (1.7 to 9.7)	0.003
Per-protocol population	11/43 (25.6)	27/44 (61.4)	2.0 (1.3 to 3.2)	4.6 (1.9 to 11.5)	0.001
Favorable outcome 12 mo after treatment completion (specifically at the time point of treatment cessation)					
mITT population	10/44 (22.7)	25/49 (51.0)	2.2 (1.2 to 4.1)	28.3 (9.6 to 47.0)	0.006

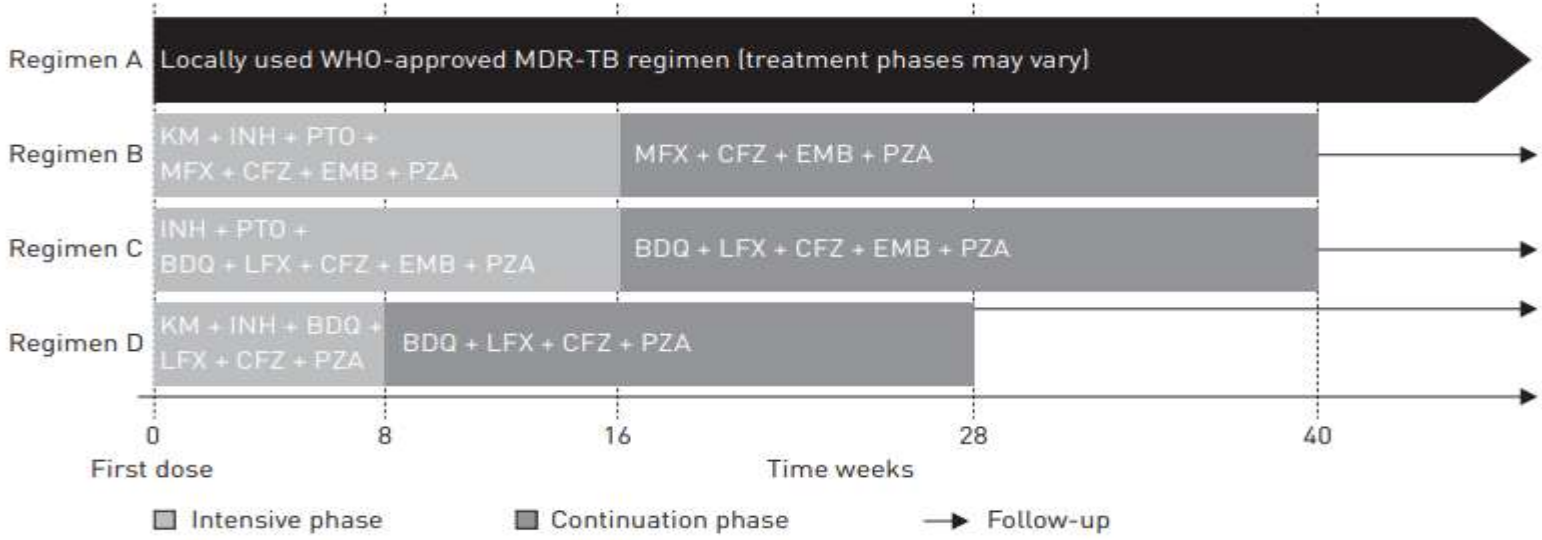
Short-course treatment for multidrug-resistant tuberculosis: the STREAM trials

Riya Moodley[1] and Thomas R. Godec[1] on behalf of the STREAM Trial Team[2]

- **STREAM stage 1**- noninferiority design, the efficacy and safety of a 9-month regimen based on the one studied in Bangladesh (regimen B) with the WHO-recommended standard of care (regimen A)
- **STREAM stage 2-**primary objectives of programmatic relevance are to assess whether the proportion of patients with a favorable efficacy outcome on regimen C and regimen D is noninferior to that on regimen B at 76 weeks



Eur Respir Rev 2016; 25: 29–35

A Trial of a Shorter Regimen for Rifampin-Resistant Tuberculosis

A.J. Nunn, P.P.J. Phillips, S.K. Meredith, C.-Y. Chiang, F. Conradie, D. Dalai, A. van Deun, P.-T. Dat, N. Lan, I. Master, T. Mebrahtu, D. Meressa, R. Moodliar, N. Ngubane, K. Sanders, S.B. Squire, G. Torrea, B. Tsogt, and I.D. Rusen, for the STREAM Study Collaborators*

STUDY	Intervention	Outcomes	
• Randomized, phase 3, noninferiority trial • Aim- to compare short regimen (9 to 11 months) with a long regimen (20 months) • 10 %points or less was used to determine noninferiority. • **N= 424**	**2:1 ratio randomisation** **short regimen** - moxifloxacin (high dose), clofazimine, ethambutol, and pyrazinamide administered over a 40-week period, supplemented by kanamycin, isoniazid, and prothionamide in the first 16 weeks **vs** **long regimen (20 months)** that followed the 2011 WHO guidelines	**Primary Outcomes-** • **Primary efficacy outcome-** favorable status at 132 weeks-defined by cultures that were negative for M. tuberculosis at 132 weeks after randomization and at a previous occasion during the trial period, with no intervening positive culture or previous unfavorable outcome • **Primary safety outcome-** occurrence of a (severe) adverse event of grade 3 or higher	• **Secondary efficacy outcomes** - times to smear and culture conversions; acquired resistance to fluoroquinolones, aminoglycosides, and pyrazinamide. • **Secondary safety outcomes** - death during the treatment and follow-up periods, an analysis of severe adverse, an analysis of QT interval prolongation, and changes in LFT results.

A Trial of a Shorter Regimen for Rifampin-Resistant Tuberculosis

A.J. Nunn, P.P.J. Phillips, S.K. Meredith, C.-Y. Chiang, F. Conradie, D. Dalai, A. van Deun, P.-T. Dat, N. Lan, I. Master, T. Mebrahtu, D. Meressa, R. Moodliar, N. Ngubane, K. Sanders, S.B. Squire, G. Torrea, B. Tsogt, and I.D. Rusen, for the STREAM Study Collaborators*

Drugs and doses by weight band in the Short regimen are shown below.

Product	Weight group		
	Less than 33 kg	33 kg to 50 kg	More than 50 kg
Moxifloxacin	400 mg	600 mg	800 mg
Clofazimine	50 mg	100 mg	100 mg
Ethambutol	800 mg	800 mg	1200 mg
Pyrazinamide	1000 mg	1500 mg	2000 mg
Isoniazid	300 mg	400 mg	600 mg
Prothionamide	250 mg	500 mg	750 mg
Kanamycin	15 mg per kilogramme body weight (maximum 1g)		

All drugs were given in a single dosage daily (seven days a week) except for kanamycin which was given three times per week from week 12. Doses could be changed at the end of the intensive phase if participants had increased weight.

Lancet 2022; 400: 1858–68

Delamanid

- Bicyclic nitroimidazooxazole derivative and is a prodrug
- It acts through inhibition of mycolic acid synthesis providing it bactericidal activity , by inhibiting methoxy-mycolic acid and keto-mycolic acid
- Activite against dormant, non-replicating bacilli, as well as those harboured within macrophages
- Resistance to delamanid is rare so far, but when encountered is frequently due to mutations in the nitroreductase that activates it
- Usual dose of 100 mg twice daily
- Bioavailability is increased with fatty food consumption
- The t half is approximately 30 h
- Most excretion is through the feces, with minimal urinary excretion
- Main reported adverse events including mild gastrointestinal symptoms or QTc prolongation

Shetye GS et al.Transl Res. 2020;220:68–97
Nguyen TVA et al. Clin Infect Dis. 2020;71(12):3252–9.

Pretomanid

- Pretomanid is a pro-drug nitroimidazooxazine molecule
- Active against replicating and dormant mycobacteria through inhibition of mycolic acid biosynthesis and nitric oxide release, respectively
- Dose -200 mg OD with food
- Five genes are associated with the emergence of resistance (ddn, fgd1, fbiA, fbiB, and fbiC)
- Crossresistance with delamanid has been observed
- Most common adverse events are gastrointestinal symptoms and vomiting and suggested to be dose related
- Symptoms are not dose related: transaminase increase, hepatotoxicity, and headache.

Nedelman JR, et al. Antimicrob Agents Chemother. 2020;65(1):e01121–20
Haver HL,et al. Antimicrob Agents Chemother. 2015;59(9):5316–23

Bedaquiline

- Class of diarylquinolines inhibiting mycobacterial ATP synthesis by inhibiting F-ATP synthase activity
- Against both replicating and non-replicating bacilli
- Terminal half-life of bedaquiline is extremely long (>5 months)
- Dosing regimen -a loading-phase (2 weeks of 400 mg once daily) and a maintenance phase (200 mg 3 times per week)
- Bedaquiline is metabolized by the cytochrome P450 CPY3A4 enzyme
- Main AEs reported include nausea/vomiting, headache, and arthralgia
- The mean change in QTc has been reported to be between 12 and 15 ms, driven primarily by the exposure to the M2 metabolite
- QT prolongation is generally in combination with other medications that may further prolong the QTc, such as clofazimine and fuoroquinolones

van Heeswijk RPG et al. J Antimicrob Chemother. 2014;69(9): 2310–8

QT EFFECTS OF BEDAQUILINE, DELAMANID OR BOTH IN PATIENTS WITH RIFAMPICIN-RESISTANT-TB: RCT

STUDY	INTERVENTION	OUTCOMES	RESULTS
• **DELIBERATE trial** • Phase 2, open-label trial in which adults with MDR/RR-TB • 84 participants	1:1:1 randomization, using permuted blocks to receive bedaquiline, delamanid, or both for 24 weeks.	The primary endpoint was mean QTcF change from baseline (averaged over weeks 8– 24).	• Patients randomized to bedaquiline (n=28), delamanid (n=27) or both medicines (n=27) - the on-treatment change in **QTcF** from baseline was 11.9 ms, 8.6 ms and 20.7 ms, respectively • Cumulative culture conversion by **Week 8** was 88% (21/24, bedaquiline), 83% (20/24 delamanid), and 95% (19/20, bedaquiline+delamanid) and was 92%, 91%, and 95%, respectively at **24 weeks**

Dooley KE et al. Lancet Infect Dis. 2021 Jul;21(7):975-983

Culture Conversion in Patients Treated with Bedaquiline and/or Delamanid

A Prospective Multicountry Study

- The endTB Observational Study
- Multicountry cohort of patients receiving bedaquiline or delamanid as part of a regimen for RR-TB or MDR-TB
- 1,106 patients

Table 2. Frequency of Sputum Culture Conversion among High-Risk Subpopulations Receiving an MDR-TB Regimen Containing BDQ and/or DLM and Risk Factors for Nonconversion ($N = 1,109$)

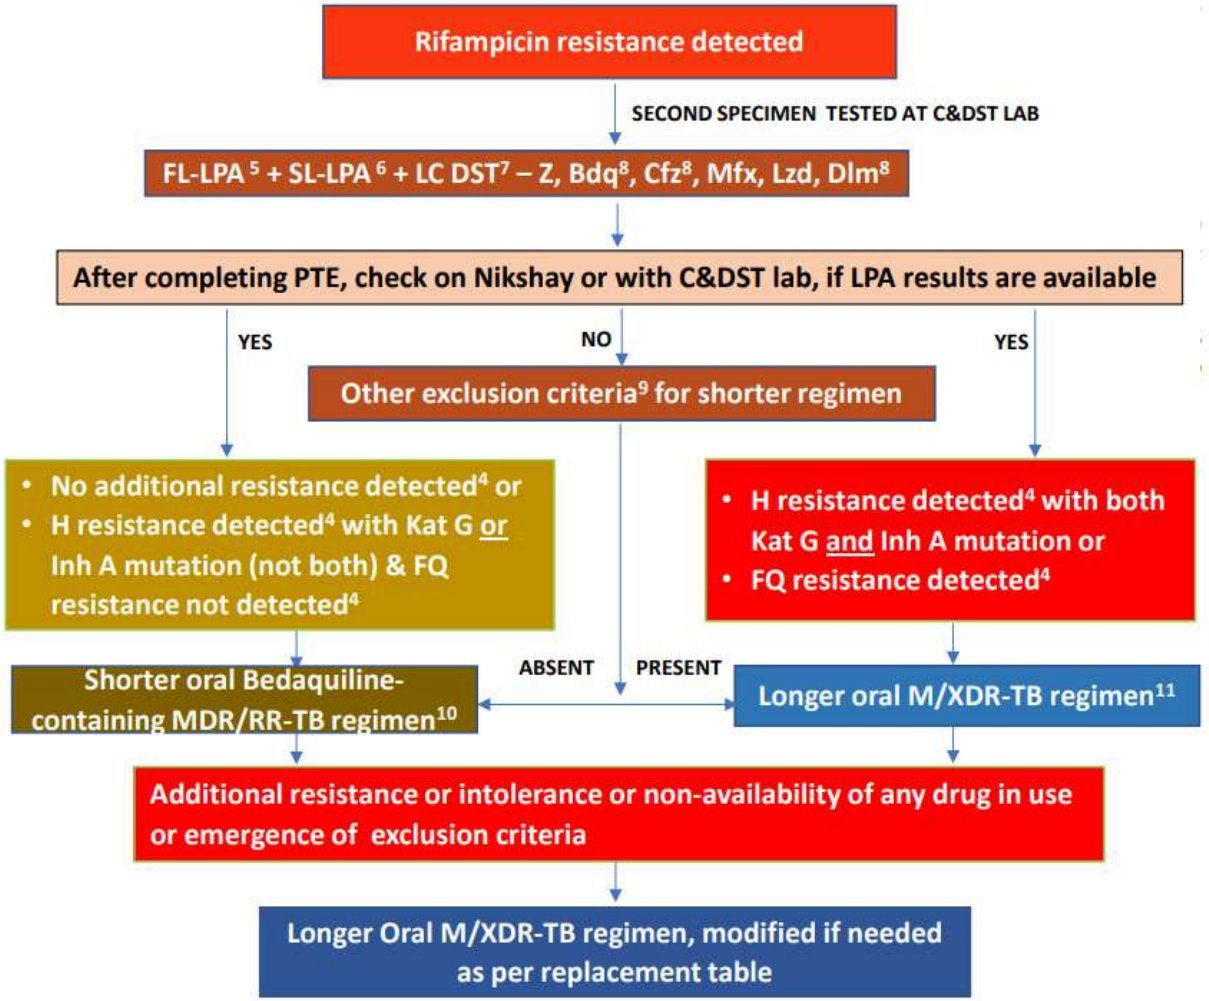
Treatment algorithm for MDR/RR-TB



PMDT 2021

Shorter oral Bedaquiline-containing MDR/RR-TB regimen

(4-6) Bdq $_{(6\ m)}$, Lfx, Cfz, Z, E, H^h, Eto	(5) Lfx, Cfz, Z, E,

Inclusion criteria

- Rifampicin resistance detected/inferred
- MDR/RR-TB with H resistance detected/inferred based on InhA mutation only or based on KatG mutation only (not both)
- MDR/RR-TB with FQ resistance not detected
- Children, aged 5 years to less than 18 years of age and weighing at least 15 kg, given their special needs, in consultation with the pediatrician
- No history of exposure to previous treatment with second-line medicines in the regimen (Bdq, Lfx, Eto or Cfz) for more than 1 month (unless susceptibility to these medicines is confirmed)

Exclusion criteria

- MDR/RR-TB patients with H resistance detected with both KatG and InhA mutation
- MDR/RR-TB patients with FQ resistance detected
- If result for FL-LPA, SL-LPA and DST to Z, BDQ* & Cfz* is not available, history of exposure for > 1 month to Bdq, Lfx, Eto or Cfz
- Intolerance to any drug or risk of toxicity from a drug in shorter oral Bedaquiline containing MDR/RR-TB regimen
- Extensive TB disease
- Severe EP-TB disease
- Pregnant and lactating women
- Children below 5 years

PMDT 2021

MDR/RR-TB patients on longer oral M/XDR-TB regimen

- All 3 Group A agents and at least 1 Group B agent should be included to ensure that treatment starts with at least 4 TB agents likely to be effective and that at least 3 agents are included for rest of the treatment if Bdq is stopped
- If the regimen cannot be composed with agents from Groups A and B alone, Group C agents are added to complete it

(18-20) Lfx Bdq $_{\text{(6 month or longer)}}$ Lzd# Cfz Cs

#dose of Lzd will be tapered to 300 mg after the initial 6–8 months of treatment

Bdq will be given for 6 months & extended beyond 6 months as an exception

Pyridoxine to be given to all DR-TB patients as per weight band

For Pre-XDR-TB and XDR-TB patients the duration of longer oral XDR-TB regimen would be for 20 months with appropriate modifications

PMDT 2021

BPaL regimen for MDR-TB with additional FQ resistance

- BPaL research proposal may be considered with flexibility to adapt with anticipated results of ZeNix trial with 4 arms of reduce dosage and duration of Linezolid in BPaL
- In exceptional cases, BPaL can be considered as a last resort by NTEP under prevailing ethical standards in individual patients for whom the design of an effective regimen is not possible as per WHO recommendations
  - Bedaquiline - 400 mg OD for the first 2 weeks and then 200 mg three times a week for 24 weeks
  - Pretomanid - 200 mg OD for 26 weeks
  - Linezolid - 1200 mg once daily for 24 weeks (after 1 month, dose and duration modification for linezolid is permissible), with an option to extend treatment to 39 weeks if they were culture-positive at week 16

PREVENTIVE TREATMENT FOR CONTACTS OF DR-TB

Clinical Infectious Diseases
MAJOR ARTICLE

Systematic Review, Meta-analysis, and Cost-effectiveness of Treatment of Latent Tuberculosis to Reduce Progression to Multidrug-Resistant Tuberculosis

Suzanne M. Marks, Sundari R. Mase, and Sapna Bamrah Morris

Objectives	Study	Outcomes	Results
• Aim- to analyze TB **incidence, treatment completion and discontinuation, and cost-effectiveness** • Persons having **contact to infectious MDR-TB**, who had documented LTBI test reactivity or presumed (for children)	21 articles that met inclusion criteria. 6 articles presented outcomes for contacts who were treated compared with those not treated for MDR-LTBI 10 presented outcomes only for treated contacts 5 presented outcomes only for untreated contacts	• Outcome **of MDR-TB incidence** was verified by culture and drug susceptibility testing, except for some children, who often are culture negative • Contacts with LTBI **effectively treated** if they were on ≥1 medication to which their MDR-TB strain was likely susceptible	• The estimated MDR-TB **incidence reduction was 90% (9%–99%)** using data from 5 comparison studies • High treatment discontinuation rates due to adverse effects in persons taking pyrazinamide-containing regimens. • Cost-effectiveness was greatest using a fluoroquinolone/ethambutol combination regimen

Marks et al. Clin Infect Dis. 2017 June 15; 64(12): 1670–1677

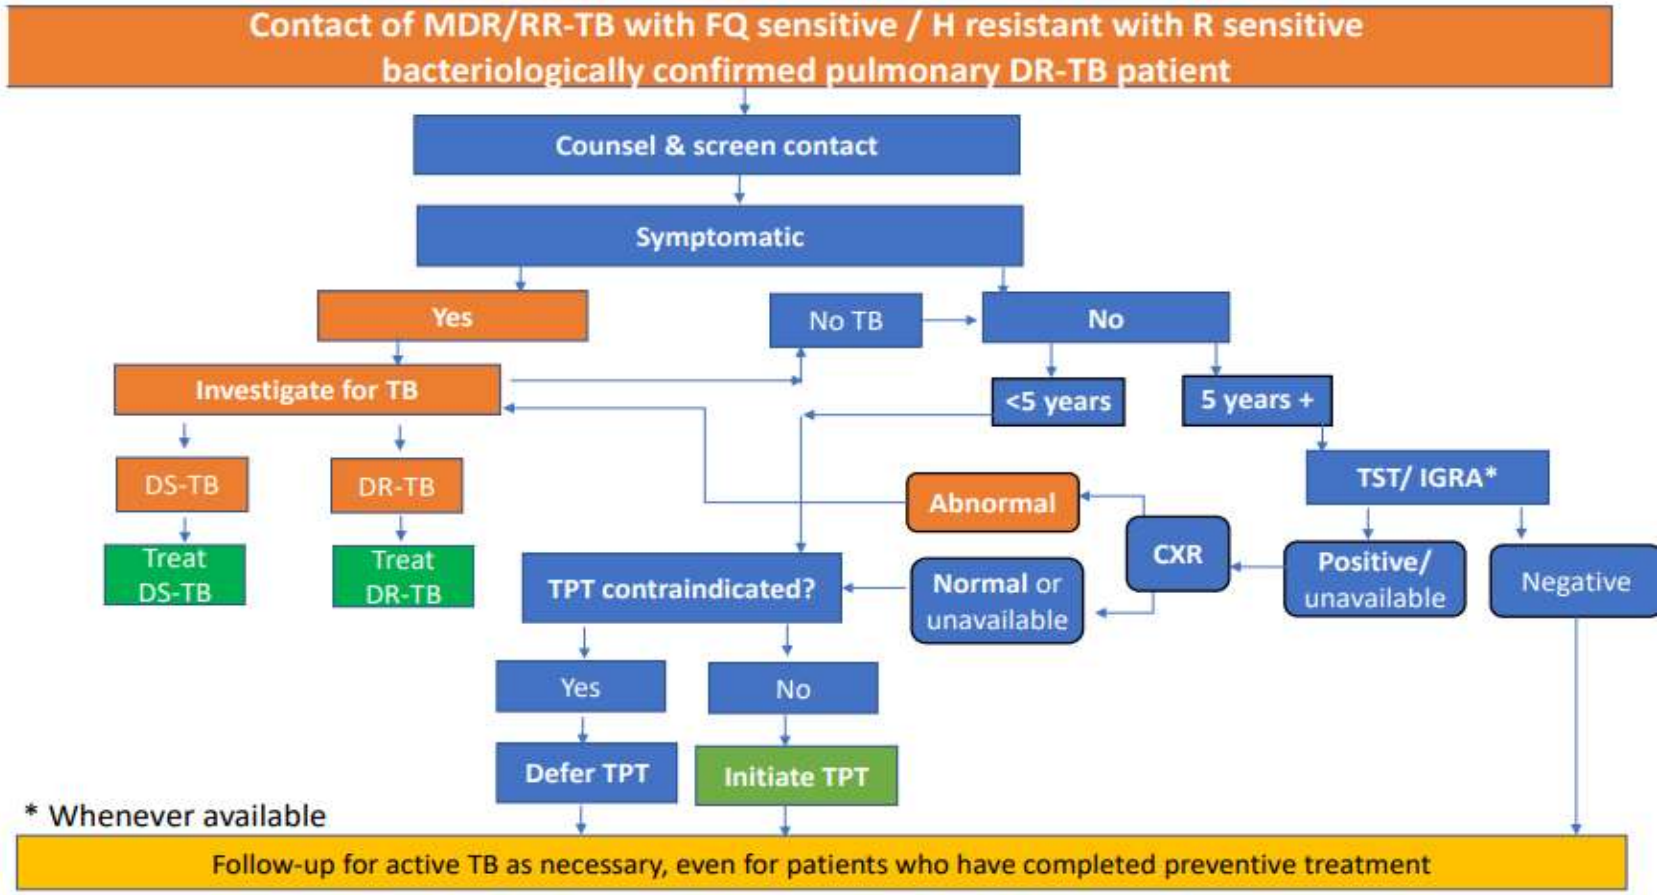
TPT for DR-TB contacts in India



- **Preventive treatment among HHC of MDR-TB index patients (in whom FQ resistance has been ruled out) -6Lfx**
- **HHC of H resistant index patients (in whom R resistance has been ruled out)-4R**
- **Regardless of whether treatment is given or not, clinical follow up should be done for two years and any emergent sing and symptoms of TB**

2022 Global New TB Drug Pipeline[1] Updated 11/3/2022

Discovery | Preclinical Development | Clinical Development

Lead Optimization → Early Stage Development → GMP / GLP Tox. → Phase 1 → Phase 2 → Phase 3 → Regulatory Market Approvals

Lead Optimization

- Indazole sulfonamides
- Diarylthiazoles
- DprE1 Inhibitors
- Direct InhA Inhibitors
- Mtb energy metabolism
- Gyrase Inhibitors
- Arylsulfonamides
- Inhibitors of MmpL3, Translocase-1, ClpC1, PKS13, F-ATP synthase
- Oxazolidinones
- DnaE1 / Nargenicin analogs

Early Stage Development

- TBD-09, TBD-10 (MK-7762, -3854)
- MPL-447*
- JSF-3285*
- CPZEN-45*
- NTB-3119*
- MBX-4888A (1810)*
- FNDR-10045*, FNDR-20364*

GMP / GLP Tox.

- GSK-839*
- OTB-658

Phase 1

- BVL-GSK098*
- GSK-286*
- TBAJ-876
- TBAJ-587
- TBI-223
- Macozinone* (PBTZ-169)

Phase 2

- Sanfetrinem
- Delpazolid
- Sutezolid
- Sudapyridine (WX-081)
- BTZ-043*
- TBA-7371*
- OPC-167832*
- GSK-656* (070)
- Telacebec*
- Pyrifazimine (TBI-166)
- SPR720*
- SQ-109*

Phase 3

Results Reported / Expected in 2022/23

- TB Practecal
- ZeNix
- Simplici TB (4-month regimen)
- Truncate TB (2-month regimens)
- STREAM 2

Regulatory Market Approvals

- Bedaquiline*
- Delamanid*
- Pretomanid*

*New chemical class. Known chemical classes for any indication are color coded: rifamycin, oxazolidinone, nitroimidazole, diarylquinoline, benzothiazinone, imidazopyridine amide, beta-lactam.

[1] New Molecular Entities not yet approved, being developed for TB or only conditionally approved for TB. Showing most advanced stage reported for each. Details for projects listed can be found at http://www.newtbdrugs.org/pipeline/clinical

Ongoing projects without a lead compound identified: http://www.newtbdrugs.org/pipeline/discovery

Underline = updates since May 2022

WORKING GROUP ON NEW TB DRUGS

www.newtbdrugs.org

Updated: November 2022

Ongoing Trials on preventive therapy for DR-TB contacts

Study	Population Type	Population Size (N)	Structure	Duration of Treatment
V-QUIN	Adults > 15 years	3344	Lfx vs. Placebo	6 months
TB-CHAMP	Children < 5 years	1556	Lfx vs. Placebo	6 months
PHOENIx	Adults > 15 years	5610	Dlm vs. H	6 months

Kherabi Y , et al . Pathogens 2022, 11, 1189

Conclusion

- CBNAAT for diagnosis of MTB and drug resistant needed upfront
- Xpert MTB/XDR improve access to rapid drug susceptibility testing, especially for ruling out fluoroquinolone resistance
- WGS should be offered after clinical , microbiological and DST correlation, WGS still not widely available and costly
- MDR TB shorter regimens has better outcomes as compared to longer regimen , can improve compliance
- For treatment of household contacts of MDR tb index case , data is based on prospective studies , results of RTCs are awaited, no data on XDR tb contact for treatment
